

Abstract

Electronic component and panel used for the production thereof

The invention relates to a sensor component (1) and a panel used for the production thereof. The sensor component (1) has, in addition to a sensor chip (2) with a sensor region (3), a rear side (7) and passive components (19). These are embedded jointly in a plastics composition (31), in such a way that their respective electrodes can be wired from an overall top side (13) of a plastic plate (6).
